

SUBSTITUTE SPECIFICATION  
U.S. Patent Application No. 10/633,639

**DOMESTIC PRIORITY INFORMATION**

[0001] This application claims the benefit of the Korean Application No. P2003-40312 filed on June 20, 2003, the entire contents of which isare hereby incorporated by reference.

**BACKGROUND OF THE INVENTION**

**Field of the Invention**

[0002] The present invention relates to a method for measuring thickness of an optical disc, ~~and more particularly, to a method for measuring thickness of an optical disc from a position of a peak value of a reflective light in an interference area obtained from Fast Fourier Transform (hereinafter referred to as FFT) of a reflective spectrum at an axis being reflected by a reflective index as a function of wavelength.~~

**Description of the Related Art**

[0003] ~~Until the present, there are~~ Various recording media exist, such as a magnetic recording tape, a Laser Disc (LD) and a Compact Disc (CD) as optical discs, and a Digital Video Disc (hereinafter referred to as DVD) ~~with a~~ that have the capacity to record vast amounts of information-recoding capacity. Since the optical disc ~~among the,~~ as compared with other recording media, utilizes a different digital recording system ~~different from previous magnetic recording tape and has very small volume and a,~~ is light weight, the optical discand is convenient to keep and carry ~~so that a user prefers,~~ many users prefer the optical disc ~~moreover~~ other recording ~~medium~~ media.

[0004] Moreover, ~~according to a trend of high~~ recording media are under development with higher density and high higher integration together with development of industry. For example, a Blu-ray Disc (BD) as a High Density DVD (HD-DVD) ~~with integration higher than the present~~

~~DVD is under investigation and development. However, any product should be used without error, and if the quality of the product deteriorates, a maker who manufactures the product loses his reliability. This case causes more series problem in the optical disc having a higher integration than current DVDs.~~

[0005] As new optical discs are developed, methods for manufacturing these products are also being developed and improved. Production of a reliable and high quality optical disc presents unique challenges since minute signal characteristics and brings associated with inferior quality originated may originate from error of errors in thickness of a disc, scratch, deformity, fingerprints scratches, deformities, fingerprints, and attachment of foreign material to the optical disc during manufacturing of the product.

~~[0005] More especially, the~~[0006] In particular, thickness variations of a disc is a major factor affecting ~~the productivity~~product quality and ~~the~~ reliability. ~~Thus, and~~ it is necessary to measure the thickness in real time for processing control ~~induring~~ manufacturing process.

~~[0006] The~~[0007] An optical disc ~~can~~may be treated ~~as~~in a manner similar to a thin film. If the thickness of the thin film is under several  $\mu\text{m}$ , the measurement of the thickness depends on a quantitative measurement such as a thin film analysis by ellipsometry and measurement of a reflection factor, ~~and if.~~ If the thickness of a ~~relative~~relatively thick thin film equal to ~~and or~~ greater ~~than~~ several  $\mu\text{m}$  is analyzed, ~~it is used a measurement method for measuring the~~ thickness ~~from~~may be measured by a vibration period ~~appeared~~appearing in a reflective or transparent spectrum due to ~~an~~ interference effect ~~by the thin film.~~

~~[0007] At that time, the wavelength resolving or the coherency of a monochromator deteriorates, but there is a valuable use of a method for~~[0008] The thickness of a thin film may be measured

by obtaining a vibration period (or frequency) of the spectrum by the interference and determining the thickness of the thin film from the obtained vibration period. However, if ~~thick as thin film, since films become thick, the time necessary time~~ to estimate the thickness of the thin film increases ~~because of appearance of a value with large period~~. In order to ~~response to demands from the industries to wish to~~ rapidly measure the thickness of ~~the thick thin film films~~, ~~the~~ conventional ~~FFT~~Fast Fourier Transform (hereinafter referred to as "FFT") is utilized as a rapid measurement ~~for of~~ the vibration period of the spectrum.

~~[0008]~~[0009] Fig. 1 illustrates ~~a schematic construction of the~~ a conventional apparatus for measuring the thickness of a thin film. ~~[0009]~~ As illustrated in FIG. 1, according to the apparatus for measuring the thickness of ~~the~~ a thin film.

[0010] As illustrated in FIG. 1, the apparatus measures the thickness of a thin film by measuring a reflectivity spectrum, ~~the light~~. Light from a halogen lamp 12 is projected on a substrate 30 with a thin film 32 through ~~one 22 of an optical fibers 20~~ fiber 22 and a lens 26, which is assigned in a perpendicular direction, ~~a with respect to the recording surface of the optical disc~~. Light reflected ~~light~~ from the substrate 20 is transmitted to a spectrograph 42 through the lens 26 and ~~another 24 of the optical fibers 20, the fiber 24~~. The spectrograph 42 splits the light reflected from a surface of a sample on the substrate 30 according to the intensity of each wavelength, ~~and the~~. The split light ~~goes into~~ is then directed to an optical measuring element arrangement 44 so that supplies the luminance intensity at each wavelength ~~is supplied to a computer 46~~. The computer 46 ~~can measure~~ determines the thickness of the thin film ~~by using a variety of ways by using the~~ luminance intensity information at each wavelength as spectrum data.

~~[0010]~~[0011] FIGS. 2A and 2B are views illustrating how a case that the refractive index is applied when may be used to determine the thickness of an optical disc measured by thea conventional method, FIG. 2A is a graph showing a luminous intensity data spectrum at each wavelength supplied to a computer according to the conventional method, and, FIG. 2B is a graph of a Fast Fourier Transform of the reflectivity spectrum by using based on the data of FIG. 2A.

~~[0011]~~[0012] As illustrated in FIGS. 2A and ~~29, 2B,~~ since  $\Delta\lambda$  can be selected, where  $\Delta\lambda$  is m times with respect to a specific wavelength  $\lambda$  and m-1 times with respect to near wavelength  $\lambda + \Delta\lambda$ , the thickness d of a specific layer in the spectrum data according to the refractive index can may be represented by the following equation 1.

~~[0012]~~[0013] [Equation 1]

~~[0013]~~[0014] At the condition  $\Delta\lambda \ll \lambda$ ,

~~[0014]~~[0015]  $2nd = m\lambda = (m-1)(\lambda + \Delta\lambda)$ , and if expanded,

~~[0015]~~

[0016]  $m\lambda = (m-1)(\lambda + \Delta\lambda) = m\lambda + m\Delta\lambda - (\lambda + \Delta\lambda)$

[0017]  $m\Delta\lambda = \lambda + \Delta\lambda$

[0018] therefore, becomes  $m\lambda = (\lambda + \Delta\lambda) / \Delta\lambda$ ,

~~[0018]~~ where,

[0019] where,  $2nd = m\lambda = \lambda(\lambda + \Delta\lambda) / \Delta\lambda \approx \lambda^2 / \Delta\lambda = 1 / \Delta(1/\lambda)$

**[0020]** Since multiplication of  $2nd$  and  $\lambda/\lambda$  is 1 (one), if, in the experiment, a relationship function between the reflectivity intensity and  $\Delta(1/\lambda)$  can be obtained, an FFT function with respect the  $2nd$  corresponding to transform factor of  $\Delta(1/\lambda)$  by taking the FFT wholly.

~~**[0020]** Where~~**[0021]** Thus, a  $d$  value, where a peak appears, is the thickness ~~we wish to obtain~~be determined.

~~**[0021]**~~**[0022]** For reference, the description for the FFT is represented to a generalized equation as follows.

~~**[0022]**~~**[0023]** A relationship equation between the intensity  $I$  and the wavelength  $\lambda$  becomes  $I = f(\lambda) = g(\Delta(1/\lambda))$ .

~~**[0023]**~~**[0024]** If applying the FFT to both sides, then the equation can be expressed as following equation 2.

~~**[0024]**~~**[0025]** [Equation 21

~~**[0025]**~~.

**[0026]** 
$$FFT\{I\} = FFT\left\{g\left(\Delta\left(\frac{1}{\lambda}\right)\right)\right\} = \int g\left(\Delta\left(\frac{1}{\lambda}\right)\right) e^{-2\pi i \left(\Delta\left(\frac{1}{\lambda}\right)\right) 2nd} d(2nd) = h(2nd)$$
 :

**[0027]** However, since the conventional method does not consider the refractive index dispersion of thin film material, the gap between peaks decreases gradually. More especially, according to the conventional art, there are disadvantages ~~that~~ since the refractive index is varied ~~by~~ depending upon the wavelength, thickness values obtained according to the refractive index for dividing a Fourier peak position are varied and reduction of size and increment of a width of the peak are caused.

~~[0027]~~[0028] Thus, since the materials ~~consist~~ of an actual thin film ~~has~~have a wavelength ~~dependency of~~dependant on the refractive index, that is, since there is a refractive index dispersion of the thin film, the energy difference caused by the interference between two lights at a frequency period is not uniform. ~~With~~For this reason, the width of the peak ~~of the frequency~~ that is obtained ~~when~~using the Fast Fourier Transform ~~of~~from the reflective spectrum is wider according to the degree of the refractive index dispersion. Furthermore, ~~and the measuring error for obtaining~~in ascertaining the thickness of the thin film because of the imprecise position of the peak ~~is increase~~increases. Therefore, in order to precisely measure the thickness of the thin film, the refractive index dispersion should be considered.

### **SUMMARY OF THE INVENTION**

~~[0028]~~[0029] Accordingly, the present invention is directed to a method for measuring thickness of an optical disc that ~~substantially obviates~~addresses one or more problems due to limitations and disadvantages of the related art.

~~[0029]~~[0030] An object of the present invention is to provide a method for ~~high~~-precisely measuring the thickness of an optical disc with a rapid speed by using a position of peak value of a reflected light in an interference area obtained by Fast Fourier Transform of a variation of refractive index according to a wavelength, that is, a spectrum being reflected with the refractive index as a function of the wavelength.

~~[0030]~~[0031] Another object of the present invention is to provide an improved method for ~~high~~-precisely measuring thickness of an optical disc by keeping accuracy of determining a peak position as well as preventing the expansion of a width of the peak when the Fourier

Transform even when a reflecting film is formed on a substrate at a uniform area ratio by a reflective light or multiple thin films are formed on the substrate.

~~[0031]~~[0032] Another object of the present invention is to provide a method for precisely measuring thickness of an optical disc to be applicable not only a reflective index spectrum but also any other spectrum vibrated by an interference of a thick thin film such as a transmittance spectrum.

~~[0032]~~[0033] Additional advantages, objects, and features of the invention will be set forth in part in the description which follows and in part will become apparent to those having ordinary skill in the art upon examination of the following or may be learned from practice of the invention. The objectives and other advantages of the invention may be realized and attained by the structure particularly pointed out in the written description and claims hereof as well as the appended drawings.

[0033][0034] To achieve these objects and other advantages and in accordance with the purpose of the invention, as embodied and broadly described herein, an example embodiment of the invention is directed to a method for measuring thickness of an optical disc by using an interference effect of the optical disc layer, ~~includes~~including the steps of detecting an intensity of a reflective light according to a wavelength of a light as a spectrum data for each wavelength, converting the detected spectrum data for each wavelength into a spectrum value as a function of a wavelength that a refractive index is reflected, and detecting a position where the intensity of the reflective light has a peak as a thickness of a spacer layer and a cover layer respectively by converting the converted value into a length of an interference area for representing a layer thickness of the optical disc by the Fast Fourier Transform.~~[0034] In another~~

~~aspect of the present invention, the spectrum value as a function of a wavelength that a refractive index is reflected prefers to be.~~

[0035] In another example embodiment of the present invention, the spectrum value as a function of a wavelength that a refractive index is reflected prefers to be  $n(\lambda)/2\lambda$ .

[0036] It is to be understood that both the foregoing general description and the following detailed description of the present invention are exemplary and explanatory and are intended to provide further explanation of the invention as claimed.

### **BRIEF DESCRIPTION OF THE DRAWINGS**

[00360037] The accompanying drawings, which are included to provide a further understanding of the invention and are incorporated in and constitute a part of this application, illustrate embodiment(s) of the invention and together with the description serve to explain the principle of the invention. In the drawings:

[00370038] FIG. 1 illustrates a schematic construction of an apparatus for measuring thickness of a thin film of an optical disc according to a related art;

[00380039] FIG. 2A illustrates a graph showing a luminous intensity in each wavelength supplied to a computer according to the related art;

[00390040] FIG. 2B illustrates a graph of Fast Fourier Transform of the reflectivity spectrum by using FIG. 2A.

[00400041] FIG. 3 illustrates a flowchart showing a method for measuring thickness of an optical disc according to the present invention;

[00410042] FIG. 4 illustrates a lateral constructive view of an optical disc for a High Density-DVD according to the present invention;

[00420043] FIG. 5A illustrates a graph showing spectrum data by wavelength by measuring an intensity of a reflective light according to a wavelength of a light according to the present invention;

[00430044] FIG. 5B illustrates a graph setting the reflective light as a vertical axis and a value that a refractive index is reflected by a function of a wavelength as a horizontal axis by using FIG. 5A;

[00440045] FIG. 5C illustrates a Fast Fourier Transform graph of the spectrum by wavelength by using FIG. 5B;

[00450046] FIG. 6 illustrates a graph showing a refractive index dispersion curve of a dielectric thin film with a thickness 30 $\mu$ m; and

[00460047] FIGS. 7A and 7B illustrate graphs showing intervals between the reflective spectrums with respect to energy through whether the refractive index dispersion of the dielectric thin film is considered or not.

### **DETAILED DESCRIPTION OF THE INVENTION**

[0047][0048] Reference will now be made in detail to the ~~preferred~~example embodiments of the present invention, ~~examples of which that~~ are illustrated in the accompanying drawings.

[0048] FIG. ~~[0049]~~ FIG. 3 illustrates ~~at a~~ flowchart showing a method for measuring the thickness of an optical disc according to the present invention, ~~FIG. 4 illustrates a lateral constructive view of an optical disc for a High Density-DVD according to an example embodiment of the present invention,~~ FIG. 5A ~~illustrates~~is a graph showing spectrum data ~~by comparing wavelength by measuring an with~~ intensity of a reflective light ~~according to a wavelength of a light according to the present invention,~~ FIG. 5B ~~illustrates,~~ FIG. 5B is a graph

setting the reflective light as a vertical axis and a value that a refractive index is reflected by a function of a wavelength as a horizontal axis ~~by using the data of FIG. 5A, and, FIG. 5C~~ illustrates a Fast Fourier Transform graph of the spectrum by wavelength ~~by using the data of~~ FIG. 5B.

~~{0049} FIG.~~ [0050] FIG. 4 illustrates ~~the an~~ optical disc ~~for such as~~ a High Density DVD (hereinafter referred to 'HD-DVD') ~~appeared before the footlights as a next generation optical recording medium recent.~~ As illustrated in FIG. 4, ~~major~~ the layers of the HD-DVD ~~are include~~ a cover layer (CL) 32a of a thickness about 80 $\mu$ m and a spacer layer (SL) 32b having thickness of 10 $\mu$ m, below the cover layer 32a. The cover layer 32a and spacer layer 32b are supported by substrate 30. Additional layers may occur in the optical disc beyond the three specifically identified.

~~{0050}~~ [0051] An apparatus for measuring thickness of the optical disc, as illustrated in FIG. 1, includes a light source, an optical fiber, a lens, a substrate with a thin film, a monochromator, an optical measuring element arrangement, and a computer.

~~{0051}~~ [0052] ~~By using~~ Using the optical disc thickness measuring apparatus ~~constructed as~~ described above, the thickness of the ~~HD DVD used as a sample for measurement is detected as~~ spectrum data by wavelength optical disc such as an HD-DVD may be measured by detecting an intensity of ~~the a~~ reflective light according to the wavelength of the light as spectrum data for each wavelength (Step S10). The detected data are illustrated in FIG. 5A.

~~{0052}~~ ~~Before the Fast Fourier Transform for the thickness measurement, taking that the refractive index varies according to the wavelength into consideration, the~~ [0053] The detected spectrum data ~~by for each~~ wavelength is then converted into spectrum data ~~that the refractive~~

~~index is reflected into the~~for each wavelength into a spectrum value that is a function of a wavelength reflective of the refractive index (Step S20). ~~At that time, an~~

~~[0054] An equation for processing the spectrum that the refractive index is reflected into the function of wavelength can~~may be expressed by the following equationEquation 3.

~~{0053} [Equation 3]~~

~~{0054}~~

[0055] [Equation 3]

[0056]  $2n(\lambda)d = m\lambda$

[0057]  $2n(\lambda + \Delta\lambda)d = (m - 1)(\lambda + \Delta\lambda)$

[0058] If developing the above second equation, then

~~{0057}~~

[0059]  $2n(\lambda)d + 2\Delta n\lambda d = m\lambda + m\Delta\lambda - \lambda - \Delta\lambda$

~~[00580060]~~ where,  $\Delta n = n(\lambda + \Delta\lambda) - n(\lambda)$ , if substituting the upper equation into the first equation and developing the substituted first equation, then

~~[00590061]~~  $m = (2\Delta n d / \Delta\lambda) + (\lambda + \Delta\lambda) / \Delta\lambda \Rightarrow$  if substituting the first equation, then

~~{0060}~~

~~{0061}~~

[0062]  $2n(\lambda)d = (2\lambda\Delta n d / \Delta\lambda) + ((\lambda + \Delta\lambda)\lambda / \Delta\lambda)$

[0063]  $2(n(\lambda) - \lambda\Delta n / \Delta\lambda)d = (\lambda + \Delta\lambda)\lambda / \Delta\lambda$

[0064]  $(2\lambda^2 / \Delta\lambda)((n(\lambda)\Delta\lambda - \lambda\Delta\lambda) / \lambda^2)d = (\lambda + \Delta\lambda)\lambda / \Delta\lambda$

[0065]  $2\Delta(n(\lambda) / \lambda)d = (\lambda + \Delta\lambda) / \lambda = 1 + \Delta\lambda / \lambda \approx 1(\Delta\lambda / \lambda < 1)$

[0066] where, the latest term can be neglected by applying a first order approximation.

[00650067] By using the function relationship with respect to  $\Delta(n(\lambda)/\lambda)$  of the intensity of the light obtained according to the equation as described above, the apparatus can obtain the spectrum data ~~that~~where the refractive index is reflected into the function of wavelength. In this regard, ~~where~~ FIG. 5B illustrates a graph setting the reflective light as a vertical axis and a value  $n(\lambda)/2\lambda$  ~~that~~in which a refractive index is reflected by a function of a wavelength as a horizontal axis.

[00660068] Finally, if the converted data in the ~~previous step~~Step S20 is converted into a length of an interference area for representing the thickness of the optical disc through the Fast Fourier Transform, then ~~a position~~the positions are determined where the intensity of the reflected light has a peak value. The position of each detected peak value becomes the thickness of the spacer layer and the cover layer (Step S30).

[00670069] FIG. 5C illustrates a graph ~~of takes~~having a vertical axis ~~as~~of the intensity of the light determined by the Fast Fourier Transform and a horizontal axis ~~as~~of the interference area representing the thickness.

[00680070] As illustrated in FIG. 5C, a peak value ~~appeared~~occurs at a position ~~of~~  $d_1$  on the horizontal axis ~~is a~~. This value ~~appeared~~appears when a refractive index  $n_1$  with respect to the spacer layer is expressed as a function of wavelength of  $n_1(\lambda)$  and converted by the Fast Fourier Transform, ~~and a value of a position where the~~. This peak value ~~appears~~ represents the thickness of the spacer layer of the optical disc. Meanwhile, a peak value ~~appeared~~ at a position ~~of~~  $d_2$  on the vertical axis is a value ~~appeared~~that occurs when a refractive index  $n_2$  with

respect to the cover layer is expressed as a function of wavelength of  $n_2(\lambda)$  and converted by the Fast Fourier Transform, ~~and a value of a position where the~~. This peak value ~~appears~~ represents the thickness of the cover layer of the optical disc.

~~{0069}~~[0071] The measurement of the thickness of the optical disc by using the Fast Fourier Transform by reflecting the refractive index into a function of wavelength ~~according to the present invention~~ will be described in detail through experimental values ~~by using~~associated with measurement of the thickness of ~~the~~a thin film.

~~[0070]~~[0072] FIG. 6 illustrates a graph showing a refractive index dispersion curve of a dielectric thin film with a thickness of 30 $\mu\text{m}$ .

~~[0071]~~[0073] As illustrated in FIG. 6, by reflecting the refractive index dispersion when the Fast Fourier Transform is performed, it can be understood that the peak width decreases and the peak size increases through the reflectivity spectrum analysis by the dielectric thin film with a thickness of 30 $\mu\text{m}$ . At that time, the dielectric thin film is defined as sole thin film to exist in ambient without a substrate layer for supporting the dielectric thin film.

~~[0072]~~[0074] This fact appears more remarkably after ~~performing~~applying the Fast Fourier Transform to cases whether the refractive index is both reflected ~~or~~and not reflected. Referring to FIGS. 7A and 7B, FIG. 7A illustrates a Fast Fourier Transform graph of the reflective spectrum when the refractive index dispersion of the dielectric thin film is not considered, ~~and~~ FIG. 7B illustrates a Fast Fourier Transform graph of the reflective spectrum when the refractive index dispersion of the dielectric thin film is reflected as a function of wavelength.

~~[0073]~~[0075] As illustrated in FIGS. 7A and 7B, in a Fast Fourier Transform graph when the refractive index dispersion is reflected, the peak width largely decreases from 1.61 $\mu\text{m}$ , to

0.44 $\mu$ m, while the peak size increases about 1.7 times. These ~~increment~~increments of the peak size and ~~decrement~~decrements of the peak width are reasonable from which a vibration interval of the reflective index spectrum becomes uniform when the refractive index dispersion is reflected so that it clearly represents the effect of the Fast Fourier Transform considering the refractive index.

[00740076] Another effect obtained when the refractive index dispersion is considered appears at a thickness value obtained after the Fast Fourier Transform. FIG. 7A illustrates ~~the~~ a graph ~~representing the~~having a horizontal axis with the thickness by fixing the refractive index to  $n=1.6$  and performing the Fast Fourier Transform. Since the dielectric thin film has different refractive index according to the wavelength as illustrated in FIG. 6, the obtained thickness value varies according to the refractive index for dividing a Fourier peak position.

[00750077] Therefore, ~~that~~ the thickness value 30.71 $\mu$ m estimated from the peak in FIG. 7A is different from the actual thickness 0.71 $\mu$ m, ~~is caused by which.~~ This occurs since the ~~used~~ refractive index of  $n=1.6$  does ~~not properly~~ reflect ~~properly~~ an effective refractive index of the reflectivity spectrum ranges in the region of 500nm to 900nm, ~~and.~~ It can be regarded an error ~~basically comes from~~since it does not takingtake the refractive index dispersion into consideration.

[00760078] However, since the refractive index dispersion is precisely reflected in FIG. 7B illustrating the Fast Fourier transform graph for considering the refractive index dispersion, a precise thickness value of 30.0 $\mu$ m is estimated so that a rapid analyzing speed and a high precise thickness measurement can be achieved.

[0077][0079] As described above, the method for measuring thickness of an optical disc by using the interference effect of the optical disc's layer has advantages as follows.

[0078][0080] First, in the measurement of the thickness of the optical disc through the peak value position of the reflected light in the interference area obtained by the Fast Fourier Transform of the reflectivity spectrum in which the refractive index dispersion of the thin film is reflected by adding an extra refractive index, the measurement of the thickness of the optical disc can be performed precisely ~~during keeping~~ while maintaining a rapid analyzing speed, so that the reliability of the measuring apparatus can be increased and the productivity can be also ~~enhance~~ enhanced.

[0079][0081] Second, according to the present invention, regardless of type and structure of the disc, a reflective layer of uniform area ratio formed on a substrate, or multiple layer thin film formed on the substrate, the thickness of the optical disc can be measured with a high precision and a rapid analyzing speed ~~as well as the~~. The measuring method of the present invention can also be applied to a spectrum having a vibration by the interference of the thick thin film such as a transmittance spectrum, ~~so that through demands for demanding a~~ having real-time measurement ~~and a precise analysis from the industries can be corresponded by means of the rapid analyzing speed and the high precise measurement of the thickness of the optical disc, and the competition power in the local and abroad markets can be enhanced~~ with precise analysis.

[0080][0082] It will be apparent to those skilled in the art than various modifications and variations can be made in the present invention. Thus, it is intended that the present invention covers the modifications and variations of this invention provided they come within the scope of the appended claims and their equivalents.
